Red Cross**

LIGHTNING FACT SHEET

There are an estimated 25 million cloud-to-ground lightning flashes each year in the United States, nearly 650,000 of which occur in Illinois alone. Lightning can be fascinating to watch, but it is also extremely dangerous – it is the underrated killer. Few people really understand the dangers of lightning. Many people don't act promptly to protect their lives, property, and the lives of others. The first step in solving this potentially life threatening problem is through education.

Lightning Safety Awareness Week in the State of Illinois is June 18 – 24, 2006. Use the information in this guide to educate yourself and others about the dangers of lightning!

Lightning Facts

- Each year, an average of 67 people are killed by lightning in the United States. This is higher than those killed by tornadoes, and second only to deaths from flash flooding.
- It is estimated that more than 1,000 people are injured by lightning strikes in the United States each year.
- In 2005, 38 people were killed and more than 300 injured by lightning strikes in the United States. One person was killed, and two injured as a result of lightning in Illinois during 2005. Lightning also resulted in nearly \$53 million in reported property damage across the country.
- In the past 45 years, ninety-seven people have been killed by lightning in Illinois.
- In 2001, Illinois recorded 5 lightning-related fatalities, and ranked SECOND among the 50 states for lightning fatalities.
- About 67% of lightning fatalities and injuries occur outdoors at recreational events (baseball games, soccer games, lakes, and on golf courses), and under or near trees.
- No place outdoors is safe when a thunderstorm is near!
- In any given year in the United States, the odds of an individual being a lightning casualty are about 280,000-to-one. The odds of winning the lottery are a HUNDRED times greater!
- Lightning results in about \$5 billion of economic impact in the United States each year. It is also one of the leading causes of forest fires.
- Lightning is most likely to happen in the spring and summer months, in the late afternoon or evening.

- Outdoors -

While no one can completely eliminate the risk of being struck by lightning, you can greatly reduce your risk of becoming a lightning casualty by following some basic rules.

- **PLAN AHEAD!** If thunderstorms are in the forecast, consider postponing outdoor activities. At the very least, have a portable NOAA Weather Radio that will alert you to changes in the weather.
- **WATCH THE SKY!** Make sure you, or someone in a group of people, monitor the weather conditions. This is especially important if you need time to get to a safe place. The static on an AM radio frequency can also alert you to approaching thunderstorms.
- **COACHES & OFFICIALS NEED A SAFETY PLAN!** Outdoor events are very susceptible to lightning strikes because these activities take place in open areas. If you, or your children, are involved in outdoor recreational activities, verify that scout leaders, coaches, umpires, referees, and camp counselors have guidelines for postponing outdoor events BEFORE thunderstorms approach. The safety of the participants and the spectators must be the number one priority!
- **USE THE 30 / 30 RULE!** When you see lightning – start counting. If you cannot count to **30** before you hear the thunder, then get indoors immediately! Once indoors, stay there for **30** minutes after hearing the last rumble of thunder before resuming outdoor activities. **REMEMBER:** this is a guideline...and is not as useful if the thunderstorm is actually forming overhead. The first strike of lightning may occur very near you. You won't have the ability to "hear it coming." So remember to keep an "eye on the sky" if clouds begin to build and darken!
- **GET AWAY FROM WATER!** Stop activities in or near water, such as swimming, boating, fishing, and camping, and seek a substantial shelter.
- **LIGHTNING SAFETY TIPS – OUTDOORS:**
 - o The **best shelter** from lightning is to be inside a **substantial building**.
 - o **Avoid** car ports, porches, garages, sheds, tents, baseball dugouts, or under bleachers.
 - o If no substantial shelter is available, then **seek refuge in a hard topped vehicle**, with the windows up.
 - o **Stay away** from trees, electrical poles, or other tall objects.
 - o If your hair stands on end, or you experience a tingling sensation – lightning may strike soon! **DO NOT LIE FLAT ON THE GROUND!** Crouch down on the balls of your feet to create the lowest profile.

- Lightning Safety On the Job -

People who work outdoors in open spaces, on or near tall objects, with explosives, or with metal have a large exposure to lightning risks. Workers in the following occupations are among those with the most risk:

- Farming and Field Labor
- Power / Utility Field Repair
- Construction and Building Maintenance
- Heavy Equipment Operation
- Plumbing and Pipefitting
- Explosives Handling or Storage
- Logging

DON'T START ANYTHING THAT CAN'T BE STOPPED QUICKLY

Pay attention to the daily forecast so you know what to expect. Be alert for early signs of thunderstorms such as increasing winds, dark clouds, rain or distant rumbles of thunder.

KNOW YOUR COMPANY'S SAFETY GUIDELINES

Businesses with high risk functions, such as explosives handling or utility repair, should have a formal lightning warning policy that meets these two requirements:

- Lightning danger warnings that can be issued in time for everyone to get to a safe location
- Access to a safe place

ASSESS YOUR LIGHTNING RISK AND TAKE ACTION

When you see lightning, use the 30/30 rule for lightning safety. Stop what you are doing immediately and take shelter in a substantial building or in a hard topped vehicle.

OBJECTS AND EQUIPMENT TO AVOID

- Anything tall or high, including roofs, scaffolding, ladders, utility poles, or trees.
- Large equipment such as bulldozers, cranes, backhoes, and tractors.
- Materials or surfaces that conduct electricity, such as metal tools or equipment, utility lines, water, water pipes, and plumbing.
- Leave areas where explosives or munitions are located or stored.

IF A CO-WORKER IS STRUCK BY LIGHTNING

Lightning victims are safe to handle – they do NOT carry any electrical charge. Call 9-1-1 IMMEDIATELY! If the victim's heart is stopped or they have stopped breathing, administer CPR immediately.

- Indoors -

A house or other substantial building offers the best protection from lightning. Open shelters, carports, garages and sheds are designed to protect people and property from rain and sun – **NOT** lightning.

There are three main ways lightning enters a building:

1. A direct strike
2. Through wires or pipes that extend outside the building
3. Through the ground

Once in a structure, the current from a lightning strike can travel through electrical lines, plumbing, phone lines, and radio or TV reception systems. Lightning can also travel through any metal wiring or bars in concrete walls or flooring.

- **AVOID CONTACT WITH CORDED PHONES** Phone use is the leading cause of indoor lightning injuries in the United States. Cordless phones are safe, as long as lightning does not strike while you are removing the phone from the charging cradle. Cell phones are the safest method of communication.
- **STAY AWAY FROM WINDOWS AND EXTERIOR DOORS** Windows and doors can provide a path for a direct strike to enter a home.
- **STAY OFF OF PORCHES AND DECKS** Even if a porch or deck is covered, it does not offer any protection from lightning strikes.
- **AVOID CONTACT WITH ELECTRICAL EQUIPMENT OR CORDS** Direct strikes and power surges due to lightning cause significant damage to personal property each year. If you plan to unplug any electronic equipment, do so well before the storm arrives. Do not forget to disconnect televisions and radios from outdoor antennas.
- **STAY AWAY FROM PLUMBING AND PLUMBING APPLIANCES** Avoid contact with pipes during a thunderstorm. Do not take a shower or bath. Avoid appliances such as dishwashers, washing machines, and electric hot water heaters, since they utilize both water and electricity.
- **BE ALERT FOR DIRECT LIGHTNING STRIKES** If your home, or a neighbor's home is directly struck by lightning, call the fire department immediately! If your home has been struck by lightning, have the electrical wiring inspected by a qualified electrical contractor as soon as possible.

- Lightning Strike Injuries -

If a person is struck by lightning, immediate medical attention may be the difference between life and death. With proper medical treatment, most victims can survive a lightning strike. However, long-term effects on their lives and the lives of their family members can be devastating.

- **VICTIMS DO NOT CARRY ANY ELECTRICAL CHARGE** It is important that lightning strike victims receive immediate medical attention – call 9-1-1! They are safe to handle and cannot injure anyone providing medical attention.
- **MOST FATALITIES FROM LIGHTNING CAUSED BY CARDIAC ARREST** The surge of electricity through a person's body results in cardiac arrest as the immediate cause of death in most lightning fatalities. Check to see if a lightning victim has a pulse and is breathing. If not, administer CPR immediately and get the victim advanced life-saving medical attention.
- **ONLY A FEW VICTIMS SUFFER BURNS** Physically, only a few lightning strike victims actually suffer burns, and these are usually minor. Most lightning burns occur in the extremities where the current either enters or exits the body.
- **SOME OF THE LONG-TERM SIDE EFFECTS REPORTED BY LIGHTNING STRIKE SURVIVORS ARE:**
 - o Memory loss
 - o Personality changes
 - o Difficulty carrying on more than one task at a time
 - o Fatigue
 - o Irreparable nerve damage
 - o Chronic pain and/or headaches
 - o Difficulty sleeping
 - o Dizziness

Note: Some symptoms may not appear until several months after the lightning strike!

The main support group for lightning strike survivors is “Lightning Strike and Electric Shock Survivors, International” (www.lightning-strike.org)

- The Science Of Lightning -

By definition, all thunderstorms contain lightning. Lightning can strike the ground or ground-based objects, within the thunderstorm cloud, from one thunderstorm to another, or into the atmosphere. Thunderstorms are most likely to develop on warm spring or summer days, but they can occur any time of the year.

THE DEVELOPMENT OF A THUNDERSTORM

Pockets of air rise into the atmosphere, either forced by a front or due to heating of the earth on a sunny day. When this air reaches a certain level in the atmosphere, cumulus clouds start to form. Continued heating of the moist air can cause these clouds to grow vertically upward in the atmosphere, into “towering cumulus” clouds. These clouds may be the first indication of a developing thunderstorm, or cumulonimbus cloud.

HOW LIGHTNING FORMS

Lightning is produced because of the mixture and collisions of ice crystals, high in the thunderstorm, with rain drops and hailstones in the lower parts of the storm. The lighter ice crystals become positively charged, and are carried into the highest parts of the cloud. Heavier hail and rain gathers a negative charge and falls toward the lower part of the cloud. The earth’s surface normally has a slight negative charge. However, as the negative charges build-up in the lower part of the cloud, the ground beneath it and surrounding locations become positively charged. Initially the air acts as an insulator between these differing charges. However, when the electrical potential between the two charges becomes too great, there is a discharge of electricity known as LIGHTNING.

LIGHTNING AND THUNDER

Lightning is the giant spark of electricity that occurs within the atmosphere. As it passes through the air, the one-inch diameter or less bolt of lightning rapidly heats the air to a temperature of 50,000 °F – which is hotter than the surface of the sun! The air expands rapidly due to the heating, then, quickly contracts as it cools back to its normal temperature. This creates a *shockwave* that we hear as THUNDER.

HEAT LIGHTNING

Heat lightning is simply the lightning from a distant thunderstorm that is too far away for the resultant thunder to be heard. In most cases, the light you observe is being reflected off of clouds, near the horizon, tens of miles away. Keep an eye on the storm though, since it may be headed in your direction.

Little Known Lightning Facts

- o Many cloud-to-ground lightning flashes have “forked” or multiple attachment points to earth. Recent studies indicated that 50-70% of cloud-to-ground lightning strikes are forked.
- o Lightning can spread out nearly 60 feet after striking the earth, depending on soil characteristics.
- o Lightning can strike the same place twice!
- o An increase in lightning activity, or a rapid change in lightning polarity can be a precursor to a severe thunderstorm or tornado.
